

## SRNE\_MODBUS PROTOCOL

Version	Revision date	Revision contents	Modified by
V3. 4	2015-08-06	This version and before, the controller fault information is defined as low 16 bits, and high 16 bits are reserved.	
V3. 5	2016-11-09	Changes to the controller fault information is placed in the high 16 bits, and the low 16 bits are reserved.	
V3. 6	2017-07-05	In example 4.7, the temperature reading address 0X0102 changed to 0X0103.  In example 4.19, the seventh byte of the message is missing the total number of bytes.  New:communication line description.	
V3. 7	2017-08-09	Add and delete document contents	
V3. 8	2018-11-06	Add PDU_E001H to set the charging current limit value, and the value should be two decimal places.	

Tel: 0755-26458295 Fax: 0755-27325578 Web: www.szshuori.com

### 1 Interface specification and serial port configuration information

#### RS232 interface:

#### RS485 interface:

Serial port rate: 9600 Check bit: NONE Data bits: 8bit Stop bit: 1bit

### 2 Communication protocol format and command analysis

#### 2.1 Format

#### 2. 2 Descriptions

1)start character: >10ms

2)address code: 1 byte, range: 01H to F7H(decimal 1 to 247), 00His a broadcast address to which all slaves respond but

do not return commands.

3)Function code:1 byte

Command name	Accessed data type	Function code	Error code
Read a single or multiple word register	2 bytes	03Н	83Н
Write a single word register	2 bytes	06H	86H
Write N word registers in a row	2 bytes	10H	90Н
Reset to factory defaults	No accessed data	78H	F8H
Clear history	No accessed data	79Н	F9H

- 4)Data:N bytes
- 5) Error check: 2 bytes, it's the CRC checksum of the address code, function code and each byte of the data.
- 6)End character:>10ms

Note

- 1)The data address and the data itself are 2 bytes, with the high byte sent first and then the low byte; for CRC, the low byte is sent first and the high byte is sent next.
- 2)The error code is the error response function code returned by the client when there is some error in the frame data sent by the server, error code=function code|80H.

#### 2.3 Notes

- 1)PDU address: (0000 to 0009)/(000A to 001A)/(0100 to 0122)/(E001 to E02D)/(F000 to F3FF), these address segments are not allowed to cross access and modification in the same command!!!
- 2)The parameters and options of this paper are for the planning and introduction of all the products of this company,so it does not mean that each product has the functions and operation of the following parameters. Refer to the instruction manual for details.
  - 3)Data below suffixed with an "H" are hexadecimal, and the others are decimal.

#### 2.4 Process flow chart

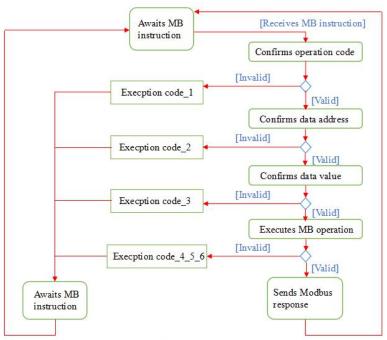

Fig. 8 Modbus process flow chart

#### 1) Exception code descriptions

- a \ 01H -- Function code not supported
- b. 02H -- PDU start address is not correct or PDU start address + data length
- c. 03H -- Data length in reading or writing register is too large
- d, 04H -- Client fails to read or write register
- e 505H -- Data check code sent by server is not correct

#### 2) Flow chart of reading register

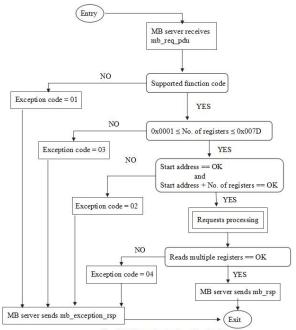

Fig. 12 Flow chart of reading holding

#### 3) Flow chart of writing a single register

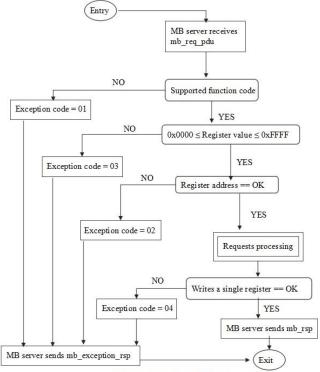

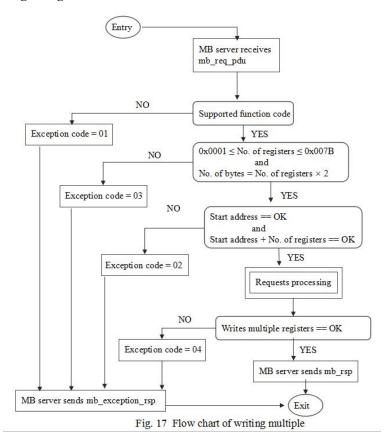

Fig. 15 Flow chart of writing a single

#### 4) Flow chart of writing N registers in a row

### 2.5 Example

#### 1) Read register

#### **Request:**

Description	No. of bytes	Command
Device address	ВҮТЕ	01H∼F7H
Function code	ВҮТЕ	03Н
Start address	WORD	0000H∼FFFFH
No. of read words	WORD	0001H~007DH
Check code	WORD	CRC checksum of all the above bytes

#### **Normal response:**

Description	No. of bytes	Command
Device address	ВҮТЕ	01H~F7H
Function code	ВҮТЕ	03H
Data length	BYTE	01H∼FAH
Data content	WORD	Data read out (High byte sent first, low byte sent next)
	WORD	Data read out (High byte sent first, low byte sent next)
Check code	WORD	CRC checksum of all the above bytes

#### **Exception response:**

Description	No. of bytes	Command
Device address	ВҮТЕ	01H∼F7H
Error code	BYTE	83H
Exception code	ВҮТЕ	N (N=1, 2, 3, 4)
Check code	WORD	CRC checksum of all the above bytes

#### 2) Write a single register

#### **Request:**

Description	No. of bytes	Command
Device	BYTE	01H∼F7H
address	DITE	Olh Th
Function	BYTE	06Н
code	DITE	
Start address	WORD	0000H∼FFFFH
Write data in	WORD	0000H~FFFFH
Check code	WORD	CRC checksum of all the above bytes

#### **Normal response:**

Description	No. of bytes	Command
Device	BYTE	01H∼F7H
address		01117 - 17 711
Function code	BYTE	06H
Start address	WORD	0000H∼FFFFH
Write data in	WORD	0000H∼FFFFH
Check code	WORD	CRC checksum of all the above bytes

#### **Exception response:**

Description	No. of bytes	Command
Device address	ВҮТЕ	01H~F7H
Error code	BYTE	86H
Exception code	ВҮТЕ	N (N=1, 2, 3, 4)
Check code	WORD	CRC checksum of all the above bytes

#### 3) Write N registers in a row

#### **Request:**

Description	No. of bytes	Command
Device address	BYTE	01H~F7H
Function code	BYTE	10H
Start address	WORD	0000H∼FFFFH
No. of written bytes	WORD	0001H~007DH

No. of written words	ВҮТЕ	One time of the No. of bytes
Data content	WORD	Data written in (High byte sent first, low byte sent next)
	WORD	Data written in (High byte sent first, low byte sent next)
Check code	WORD	CRC checksum of all the above bytes

#### Normal response:

Description	No. of bytes	Command			
Device	BYTE	01H∼F7H			
address	DITE	0111 1711			
Function code	BYTE	10H			
Start address	WORD	0000H∼FFFFH			
No. of written	WORD	000111- 007D11			
bytes	WOKD	0001H~007DH			
Check code	WORD	CRC checksum of all the above bytes			

#### **Exception response:**

Description	No. of bytes	Command			
Device	BYTE	01H∼F7H			
address	DITE				
Error code	BYTE	90H			
Exception	DVTE	N (N-1 2 2 4)			
code	BYTE	N (N=1, 2, 3, 4)			
Check code	WORD	CRC checksum of all the above bytes			

#### 4) Reset to factory defaults

#### **Request:**

Description	No. of bytes	Command
Device address	BYTE	01H∼F7H
Function code	BYTE	78H
Complementary data	WORD	0000Н
Complementary data	WORD	0001H
Check code	WORD	CRC checksum of all the above bytes

#### Normal response:

Description	No. of bytes	Command			
Device address	BYTE	01H∼F7H			
Function code	BYTE	78H			
Complementary data	WORD	0000Н			
Complementary data	WORD	0001H			
Check code	WORD	CRC checksum of all the above bytes			

#### **Exception response:**

Description	No. of bytes	Command				
Device	BYTE	01H∼F7H				
address	DITE	UIH'~F/H 				
Error code	BYTE	F8H				
Exception	DVTE	N (N-1 2 2 4)				
code	BYTE	N (N=1, 2, 3, 4)				
Check code	WORD	CRC checksum of all the above bytes				

#### 5) Clear history

#### **Request:**

Description	No. of bytes	Command			
Device address	BYTE	01H∼F7H			
Function code	BYTE	79Н			
Complementary data	WORD	0000Н			
Complementary data	WORD	0001H			
Check code	WORD	CRC checksum of all the above bytes			

#### **Normal response:**

Description	No. of bytes	Command				
Device	BYTE	01H∼F7H				
address						
Function code	BYTE	79Н				
Complementa	WODD	0000Н				
ry data	WORD	0000H				

Complementa ry data	WORD	0001H
Check code WORD		CRC checksum of all the above bytes

#### **Exception response:**

Description	No. of bytes	Command			
Device	BYTE	01H∼F7H			
address	DITE	0111 1711			
Error code	BYTE	F9H			
Exception	BYTE	N (N=1, 2, 3, 4)			
code	DITE	N (N=1, 2, 3, 4)			
Check code	WORD	CRC checksum of all the above bytes			

### 3 PDU address distribution table

	Reserved (20 bytes)								
PDU address	B yt es	R/ W	Unit	Description	Data (range)	Analysis	Return data	Parse instance (the data below is decimal data)	
0000H ~ 0009H	20	-		Reserved					
				Syster	m information	(34 bytes)

### 4 Command parses and paradigms

4.1. Read the voltage and current of the controller system

PDU address	Bytes	R/W	Da	Meaning	
		R	8 higher bits:	0CH (decimal 12)	12V
	2			18H (decimal 24)	24V
000AH				24H (decimal 36)	36V
				30H (decimal 48)	48V
				60H (decimal 96)	96V

			FFH (decimal 255)	Automatic recognition of system voltage
		0AH (decimal 10)	10A	
		0.1 1.4	14H (decimal 20)	20A
		8 lower bits:	1EH (decimal 30)	30A
		system current	2DH (decimal 45)	45A
			3CH (decimal 60)	60A

According to "Table 1", the PDU address is known to be 000AH. Read 1 word (2 bytes)

To send: 01 03 000A 0001 A408 To receive: 01 03 02 181E 324C

Parsing: high byte 18H indicates the controller's system voltage is 24V, and low byte 1EH indicates the system current is 30A.

4. 2. To read the controller's model, and the PDU addresses are known to be 000CH to 0013H in sequence and occupy a total of 16 bytes. Assume these addresses store the following data (ASCII) in sequence:

To send: 01 03 000C 0008 840F

To receive: 01 03 10 2020 2020 4D54 3438 3330 2020 2020 2020 EE98

Parsing: this controller's model is MT4830 (the ASCII corresponding to 20H is ' ', and space can be neglected)

4. 3. To read the controller's software version and hardware version, and the PDU addresses are known to be 0014H, 0015H, 0016H and 0017H in sequence

To send:01 03 0014 0004 040D

To receive:01 03 08 0003 0201 0001 0203 8A54

Parsing: (the highest byte OOH is not used) 030201H indicates the controller's software version is V03.02.01 (the highest byte OOH is not used) 010203H indicates the controller's hardware version is V01.02.03

4. 4. To read the controller's product serial number and the PDU addresses are 0018H and 0019H in sequence as shown in "Table 1"

To send: 01 03 0018 0002 440C

To receive:01 03 04 0F01 FFFF A957

Parsing: 0F01 FFFFH is the product serial number, indicating it's the 65535th (hexadecimal FFFFH) unit produced in Jan. of 2015

4. 5. To read battery capacity SOC, and the PDU address is known to be 0100H

To send: 01 03 0100 0001 85F6 To receive: 01 03 02 0064 B9AF

Parsing: (the highest byte OOH is not used) the battery capacity SOC is 64H% (decimal 100%)

4. 6. To read battery voltage:

Multiply the battery voltage reading by 0.1

The PDU address is known to be 0101H

To send: 01 03 0101 0001 D436 To receive: 01 03 02 007B F867

Parsing: formula (battery voltage = battery voltage \* 0.1) Battery voltage: (007BH, decimal 123), 007BH \* 0.1 = 12.3V

 $4.7\sqrt{10}$  To read the battery's surface temperature and controller temperature, and the PDU addresses are known to be 0103

The high 8 bits represent the temperature of the controller, and the lower 8 bits represent the temperature of the battery.

To send: 01 03 0103 0001 75F6 To receive: 01 03 02 1B19 737E

Analytic: 1B19H represent the temperature of the controller is 1BH (27  $^{\circ}$ C), the surface temperature of the battery for 19H(25  $^{\circ}$ C)

4. 8. To read load voltage, current and power, and the PDU addresses are known to be 0104H, 0105H and 0106H in sequence

To send: 01 03 0104 0003 45F6

To receive: 01 03 06 0078 00C8 00F0 00C5

Parsing:

Formula: load voltage = load voltage \* 0.1

0078H is the load voltage, so the actual load voltage is: 0078H \* 0.1 = 120 \* 0.1 = 12.0V

Formula: load current =load current \* 0.01

00C8H is the load current, so the actual load current is: 00C8H \* 0.01 = 200 \* 0.01 = 2.00A

00F0H is the load power (decimal 240W) which can also be calculated via formula: load voltage \* load current

4.9. To read solar panel voltage, charging current and charging power, and the PDU addresses are known to be 0107H, 0108H and 0109H in sequence

To send: 01 03 0107 0003 B5F6 To receive: 0090 0096 00D8 011E

Parsing:

Formula: solar panel voltage = solar panel voltage \* 0.1

00AAH is the solar panel voltage reading, so the actual solar panel voltage is: 0090H \* 0.1 = 144 \* 0.1 = 14.4V

Formula: solar panel charging current = solar panel charging current \* 0.01

0096H is solar panel charging current reading, so the actual solar panel charging current is: 0096H \* 0.01 = 150 \* 0.01 = 1.50A

00D8H is solar panel charging power (decimal 216 W) which can also be calculated via formula: solar panel voltage \* solar panel charging current

4. 10 °C To read the current day's min. battery voltage, max. battery voltage, max. charging current, max. discharging current, max. charging power, max. discharging power, charging amp-hrs, discharging amp-hrs, power generation, power consumption, and the PDU addresses are 010BH to 0114H in sequence as shown in "Table 1"

To send: 01 03 010B 0003 75F5

To receive: 01 03 06 0070 0084 00D8 20CD

Parsing: in the returned command

The 4th and 5th bytes 0070H indicate the current day's min. battery voltage: 0070H \* 0.1 = 112 \* 0.1 = 112 \* 0.1

11.2V

The 6th and 7th bytes 0084H indicate the current day's max. battery voltage: 0084H \* 0.1 = 132 \* 0.1 = 13.2V

The 8th and 9th bytes 00D8H indicate the current day's max. charging current: 00D8H \* 0.01 = 216 \* 0.01 = 2.16V

E.g.: to read the controller's charging amp-hrs and discharging amp-hrs on the current day, and the PDU addresses are known to be 0111H and 0112H respectively

To send: 01 03 00111 0002 31D4 To receive: 01 03 04 0608 0810 7D75

Parsing: the 4th and 5th bytes 0608H are the current day's charging amp-hrs (decimal 1544AH);

Parsing: the 6th and 7th bytes 0810H are the current day's discharging amp-hrs (decimal 2064AH)

4.11 . To read the number of operating days, over-discharges and full-charges, and the PDU addresses are 0115H, 0116H and 0117H respectively.

To send: 01 03 0115 0003 15F3

To receive: 01 03 06 0008 0001 0006 1176

Parsing:

days.

The 4th and 5th bytes 0008H are the number of operating days, indicating the system has operated for 8

The 6th and 7th bytes 0001H are the number of over-discharges, indicating th battery has been over-discharged once.

The 8th and 9th bytes 0006H are the number of full-charges, indicating the battery has been fully charged for 6 times.

4. 12. To read the battery's total charging amp-hrs and discharging amp-hrs, and the PDU addresses are known to be 0118H, 0119H, 011AH and 011BH in sequence

To send: 01 03 0118 0004 C5F2

To receive: 01 03 08 0001 0203 0000 0108 C0A3

Parsing: the 4th to 7th bytes 00010203H are the battery's total charging amp-hrs (decimal 66051AH = 66.051KAH)

The 8th to 11th bytes 00000108H are the battery's total discharging amp-hrs (decimal 264AH = 0.264KAH)

4. 13 . To read the controller's cumulative power generation and cumulative power consumption, and the PDU addresses are known to be 011CH to 011FH in sequence and occupy a total of 8 bytes.

To send: 01 03 011C 0004 840F

To receive: 01 03 08 0000 07D0 0000 03E8 550C

Parsing: 000007D0H are the controller's cumulative power generation (decimal 2000 kilowatt-hours)

The 8th to 11th bytes 000003E8H are the cumulative power consumption (decimal 1000 kilowatt-hours)

4. 14. To read load status, brightness and battery status, and the PDU addresses are known to be 0120H

PDU address	Bytes	R/W	Item	Val	lue	Meaning
			Load status	0 or 1	High byte	b7:0 indicates the load is off, 1 indicates the load is on
			Load	00 to		b0 to b6: brightness
			brightness	64H		value
						00H: charging
						deactivated
						01H: charging
						activated
0120H	2	R				02H: mppt charging
						mode
			Dattama atataa		Low	03H: equalizing
			Battery status		byte	charging mode
						04H: boost charging
						mode
						05H: floating
						charging mode
						06H: constant current
						(overpower)

To send: 01 03 0120 0001 843C To receive: 01 03 02 E402 7285 Parsing: E4H is (80H | 64H)

The 4th byte b7 being 1 indicates the street light is on, otherwise it's off, and b0 **to** b6 being 64H indicates the street light's brightness is 100%

The 5th byte 02H indicates mppt charging mode is in operation (for parsing of other statuses, refer to "PDU Address Allocation Table")

4. 15. To read faults and warnings, and the PDU addresses are 0121H and 0122H respectively

PDU address	Bytes	R/W	Item	byte	Meaning
0121H	4	R	Controller fault	16 High	B31 reserved

0122H		and warning	bit	B30: circuit, charge MOS
		information		short circuit
				B29: Anti-reverse MOS short
				B28: solar panel reversely
				connected
				B27 solar panel working
				point over-voltage
				B26: solar panel
				counter-current
				B25: photovoltaic input side
				over-voltage
				B24: photovoltaic input side
				short circuit
				B23: photovoltaic input
				overpower
				B22: ambient temperature
				too high
				B21: controller temperature
				too high
				B20: load overpower
				or load over-current
				B19: load short circuit
				B18: battery over-voltage
				B17: battery under-voltage
				B16: battery over-discharge

To send: 01 03 0121 0002 95FD To receive: 01 03 04 0101 0000 AA0F

Parsing:

The first four or five bytes for the fault information of the high 16 bit B24, 0101H for 1, said the photovoltaic input side short circuit, B16 1 said the battery over discharge

(for parsing of other fault codes, refer to the "Meaning" column of the "PDU Address Allocation Table")

4.16. To turn on the load, and knowing the PDU address is 010AH, you need write on/ off command into this address (0001 to turn on the load, 0000 to turn off the load)

To turn on the load:

To send: 01 06 010A 0001 69F4 To receive:01 06 010A 0001 69F4

To turn off the load:

To send: 01 06 010A 0000 A834 To receive: 01 06 010A 0000 A834

4. 17. To read street light brightness, and the PDU address is known to be 0120H

To send: 01 03 0120 0001 843C To receive: 01 03 02 E400 F344

Parsing:

The highest bit is responsible for turning on the street light, and the 7 lower bits of the high byte are for adjusting the brightness value, E4H&7FH = 64H = 100%

4. 18. To set over-voltage threshold, charging limit voltage, equalizing charging voltage, boost charging voltage, floating charging voltage, boost charging recovery voltage, over-discharge recovery voltage, over-discharge voltage, boost charging time, equalizing charging interval, temperature compensation factor.

The addresses are known to be E005H to E014H in sequence, and occupy a total of 16 words or 32 bytes.

- 1) For each setting range, refer to the "Meaning" column of the "PDU Address Allocation Table".
- 2) . The following table sets the project not all controller support modification, and the controller specification is the subject.

Note: a controller, battery type is SLD, when you issued the following orders, can send the command prompt to success. But your controller is not allowed to change, because the battery type is a custom "User" or "LI" lithium-ion batteries to support some parameter modify command, on the other hand is the controller factory setting parameters)

E.g.:

Item to set	Data	Data to send
Item to set	processing	Data to send
Over-voltage threshold 17.0V	Multiplied	17.0 * 10 = 170, hexadecimal
	by 10	00AAH
Charging limit voltage 15.5V	Multiplied	15.5 * 10 = 155, hexadecimal
	by 10	009BH
Equalizing charging voltage	Multiplied	14.6 * 10 = 146, hexadecimal
14.6V	by 10	0092Н
Boost charging voltage 14.4V	Multiplied	14.4 * 10 = 144, hexadecimal
	by 10	0090Н
Floating charging voltage	Multiplied	13.8 * 10 = 138, hexadecimal
13.8V	by 10	008AH
Boost charging recovery	Multiplied	13.2 * 10 = 132, hexadecimal
voltage 13.2V	by 10	0084H
Over-discharge recovery	Multiplied	12.6 * 10 = 126, hexadecimal
voltage 12.6V	by 10	007EH
Under-voltage threshold 17.0	Multiplied	12.0 * 10 = 120, hexadecimal
V	by 10	0078H
Over-discharge voltage 11.0V	Multiplied	11.0 * 10 = 110, hexadecimal
	by 10	006ЕН
Over-discharge limit voltage	Multiplied	10.5 * 10 = 105, hexadecimal
10.5V	by 10	0069Н

End of charge and discharge	100<<8 50, hexadecimal 6432H
capacity 100% 50%	
Over-discharge time delay 5S	Hexadecimal 0005H
Equalizing charging time	003CH
60min	
Boost charging time 60min	003CH
Equalizing charging interval	001EH
30 days	
Temperature compensation	0005H
factor 5 mV/ °C/ 2V	

To send: 01 10 E005 0010 20 00AA 009B 0092 0090 008A 0084 007E 0078 006E 0069 6432 0005 003C

003C 001E 0005 9676

To receive: 01 10 E005 0010 E604

#### 4. 19. To set load working mode, and the PDU address is known to be E01DH

PDU address	Bytes	R/W	Item	Value	Meaning
E01DH 2 R/W				00H	Sole light control, light control over on/ off of load
			01H	Load is turned on by light control, and goes off after a time delay of 1 hours	
			02H	Load is turned on by light control, and goes off after a time delay of 2 hours	
			03Н	Load is turned on by light control, and goes off after a time delay of 3 hours	
	Load working modes	04H	Load is turned on by light control, and goes off after a time delay of 4 hours		
			05Н	Load is turned on by light control, and goes off after a time delay of 5 hours	
				06H	Load is turned on by light control, and goes off after a time delay of 6 hours
				07Н	Load is turned on by light control, and goes off after a time delay of 7 hours
				08H	Load is turned on by light control, and goes off after a time delay of 8 hours

	09Н	Load is turned on by light control, and goes off after a time delay of 9 hours	
	0AH (decimal 10)	Load is turned on by light control, and goes off after a time delay of 10 hours	
	0BH (decimal 11)	Load is turned on by light control, and goes off after a time delay of 11 hours	
		0CH (decimal 12)	Load is turned on by light control, and goes off after a time delay of 12 hours
	0DH (decimal 13)	Load is turned on by light control, and goes off after a time delay of 13 hours	
	0EH (decimal 14)	Load is turned on by light control, and goes off after a time delay of 14 hours	
	0FH (decimal 15)	Manual mode	
	10H (decimal 16)	Debugging mode	
		11H (decimal 17)	Normal on mode

According to the "PDU Address Allocation Table", if "load is turned on by light control, and goes off after a time delay of 8 hours" needs to be set to, send command 0008H

To send: 01 06 E01D 0008 2FCA To receive: 01 06 E01D 0008 2FCA

#### 4. 20 Read historical data

Function code acquisition method: read the historical data from the N day , (F000H  $\mid$  N),(N=0~3FFH) , Maximum readable 1023 day data.

Read 20 bytes of historical data from the 3 day:  $F003H = (F000H \mid 0003H)$ 

To send: 01 03 F003 000A 06CD

The returned data is a 100-day historical data block of 20 bytes, beginning with the fourth byte of each successive byte:the current day's min. battery voltage, max. battery voltage, max. charging current, max. discharging current, max. charging power, max. discharging power, charging amp-hrs, discharging amp-hrs, power generation, power consumption

#### 4. 21 Reset to factory defaults

To send: 01 78 0000 0001 6000 To receive: 01 78 0000 0001 6000

Parsing: 01 is the id number, 78 is the command to reset to factory defaults, and 6000 is for checking.

#### 4. 22 Clear history

To send: 01 79 0000 0001 5DC0 To receive: 01 79 0000 0001 5DC0

Parsing: 01 is the id number, 79 is the command to clear history, and 5DC0 is for checking.

#### 4.23. Set the charge limit current

Example:

Need to set the charging current value 20.00A, retain 2 decimal places, first expand the data by 100 times, 20\*100=2000,

Get hex 7D0H

Send: 01 06 E001 07D0 EC66 Receive: 01 06 E001 07D0 EC66
